

The Artex BioRail Free Stall System is our most popular freestall mounting option. This twin-rail mount system was designed for versatility, stability and installation efficiency.

The BioRail creates a triangle of strength with a 3-point connection that offers the best resistance to torque. It also provides the greatest flexibility for both height and width stall adjustments, with no on-site welding required.

Why Opt For a Suspended Stall Design?

- No mounts in the bedding
- No mounts in or on the concrete
- Saves on labour and concrete during construction
- Ideal for deep bedded stalls using sand or compost
- Allows for adjustments in spacing width and height

As a Fundamental Part of the Comfort Zone™, the Bio-Rail free stall mounting system gives you:

- Additional structural strength when compared to a single rail system
- Unobstructed lunge space when compared to lower mounted rail systems

The Bio-Rail free stall system is compatible with all of our loop styles, including the Y2K, J2K, H2K and Artex's newly added SY2K loop.

A variety of install options are available:

Double and Single T Post Mounts for Y2K loops

Wood Post Clamps and 1.37m (4 1/2") Round Post Clamps
